

Google Ads API Access Request

Basic Access — Developer Token Application

Submitted by: Mi Marketing Industrial · May 2026 · Confidential

Applicant	Mi Marketing Industrial
Contact email	mimarketingindustrial@gmail.com
Application name	Mi Marketing Industrial — Google Ads MCP Server
Access type	Basic Access (Developer Token)
Document date	May 26, 2026

Executive Summary

Mi Marketing Industrial is a digital marketing agency based in Mexico specializing in paid advertising for medical and healthcare professionals. We are requesting **Basic Access** to the Google Ads API to power our internal **Google Ads MCP Server** — a locally-run tool that connects to Claude Desktop (an AI assistant) via the Model Context Protocol (MCP), allowing our team to query campaign performance, manage statuses, and generate performance reports through natural-language commands on behalf of our managed client accounts.

1. About Mi Marketing Industrial

Mi Marketing Industrial is a digital marketing agency operating in Mexico, with a primary focus on healthcare and medical professionals. Our clients include gynecologists, general surgeons, urologists, cardiologists, and specialized clinics across multiple cities in Mexico.

We manage advertising campaigns across major platforms including Meta Ads and Google Ads, handling campaign strategy, creative production, audience targeting, budget management, and performance reporting for over 40 active client accounts.

Business Profile

Company name	Mi Marketing Industrial
Industry	Digital Marketing Agency — Healthcare Sector
Location	Mexico
Contact	mimarketingindustrial@gmail.com
Active accounts	40+ managed Google Ads accounts under one MCC
Use of API	Internal tooling — managing client campaigns on their behalf

Role in the Google Ads Ecosystem

Mi Marketing Industrial operates as a **third-party manager**: clients grant access to their individual Google Ads accounts through our Manager Account (MCC). All API usage is scoped to accounts for which we have explicit client authorization. We do not resell API access or provide API credentials to end clients.

2. Application Description

The **Google Ads MCP Server** is a lightweight, locally-run background process that integrates Google Ads management capabilities into an AI assistant workflow. It is built exclusively for internal use by the Mi Marketing Industrial team.

How It Works

The application runs on the analyst's Windows machine and communicates with **Claude Desktop** (Anthropic's AI assistant) via the **Model Context Protocol (MCP)** — a standardized stdio-based protocol for connecting AI models to external tools. When our team member asks the AI assistant a question such as *"Which campaigns are active for Dr. García?"* or *"Pause the underperforming campaigns in account 123456789"*, the AI model invokes the appropriate MCP tool, which in turn calls the Google Ads API and returns structured results.

Analyst		Claude Desktop (AI Assistant)		MCP Server (google_ads.exe)		Google Ads API
Types natural-language question or instruction	→	Interprets intent, selects appropriate MCP tool	→ MCP stdio ←	Executes GAQL query or mutate operation	→ HTTPS ←	Returns campaign data, metrics, or confirmation

Application Characteristics

- **Deployment:** Runs locally on the analyst's machine. No cloud server, no public endpoint, no third-party hosting.
- **Users:** Internal Mi Marketing Industrial staff only. Client credentials are never exposed to end clients.
- **Distribution:** Not a public or commercial software product. It is a private internal tool packaged as a Windows executable (.exe) for ease of deployment within the team.
- **Concurrency:** Single-user, single-process. One analyst uses the tool at a time from their own machine with their own OAuth credentials.
- **API call volume:** Low to moderate. Calls are triggered by analyst queries during working hours, not by automated batch processes. Estimated: fewer than 500 API operations per day.

3. Intended API Usage

The application uses the Google Ads API exclusively for the following business workflows, all of which are performed on client accounts managed by Mi Marketing Industrial:

1	Campaign Status Review The analyst asks the AI assistant to list all active campaigns for a specific client account, including budget and channel type. This replaces the need to manually navigate the Google Ads interface for each account.
2	Cross-Account Dashboard Retrieve active campaigns across all managed accounts in a single query. Used for morning status checks and to identify accounts that may need attention.
3	Performance Reporting Query key performance indicators (impressions, clicks, CTR, spend, CPC, CPM, conversions, CPA, ROAS) for a specified date range. Used to prepare weekly and monthly reports for clients.
4	Money Leak Detection Automatically flag campaigns that are spending budget without generating conversions, have unusually low CTR, or have a CPA above defined thresholds. This allows the team to proactively identify underperforming campaigns.
5	Status Management Enable or pause campaigns, ad groups, or individual ads as directed by the analyst. Used when a client requests urgent pausing of a campaign or when the team identifies a creative that needs to be stopped.
6	Disapproval Monitoring Scan all active ads for disapproval or policy flags. Used to quickly identify ads that are not serving due to Google policy issues and alert the client.

4. API Services & Features Required

The following Google Ads API services and report resources are used by the application. All usage is limited to the accounts accessible through our Manager Account (MCC).

API Service	Method / Resource	Purpose in Application
CustomerService	<code>list_accessible_customers()</code>	Enumerate all accounts linked to the MCC for cross-account campaign discovery.
GoogleAdsService	<code>search_stream()</code> – campaign	Read campaign name, status, budget, and advertising channel type.
GoogleAdsService	<code>search_stream()</code> – metrics	Read impressions, clicks, CTR, cost, CPM, CPC, conversions, CPA, ROAS for date-range reports.
GoogleAdsService	<code>search_stream()</code> – ad_group_ad	Read ad approval/policy status to detect disapproved ads.
CampaignService	<code>mutate_campaigns()</code>	Enable or pause campaigns on analyst instruction.
AdGroupService	<code>mutate_ad_groups()</code>	Enable or pause ad groups on analyst instruction.
AdGroupAdService	<code>mutate_ad_group_ads()</code>	Enable or pause individual ads on analyst instruction.

GAQL Report Resources Used

All read operations use Google Ads Query Language (GAQL) with `search_stream()`. The following report resources are queried:

Resource	Fields Accessed	Purpose
campaign	campaign.id, campaign.name, campaign.status, campaign.advertising_channel_type, campaign_budget.amount_micros, customer.descriptive_name	Campaign listing and discovery.
campaign (with segments)	metrics.impressions, metrics.clicks, metrics.ctr, metrics.cost_micros, metrics.average_cpm, metrics.average_cpc, metrics.conversions, metrics.cost_per_conversion, metrics.conversions_value, segments.date	Date-range performance reports and money-leak detection.
ad_group_ad	campaign.name, campaign.status, ad_group.name, ad_group.status, ad_group_ad.ad.id, ad_group_ad.status, ad_group_ad.policy_summary.approval_status	Ad disapproval and policy monitoring.

5. Data Access & Scope

What Data Is Accessed

- Campaign metadata: name, ID, status, budget, channel type.
- Ad group metadata: name, ID, status.
- Ad metadata: ID, status, policy/approval status.
- Performance metrics: impressions, clicks, spend, CTR, CPC, CPM, conversions, CPA, ROAS.
- Account metadata: account name and ID, accessible via the MCC.

What Data Is NOT Accessed

- No user personal data, audience lists, or customer match data.
- No billing or payment information.
- No keyword-level or search term data.
- No creative asset files (images, videos).
- No data from Google Analytics or any linked property.

Data Storage & Retention

The application does **not persist any data** retrieved from the API. All results are returned directly to the AI assistant as text strings and displayed to the analyst in the session. No database, log file, or external storage of API response data is maintained. OAuth credentials (refresh token, client secret) are stored locally in a .env file on the analyst's machine and are never transmitted to any third party.

Account Access Scope

API calls are made using the analyst's own OAuth2 refresh token, scoped to `https://www.googleapis.com/auth/adwords`. The Login Customer ID is set to our MCC account ID. Access is limited to the client accounts that have granted manager access to our MCC — no account data outside this scope can be reached.

6. Security & Compliance

Mi Marketing Industrial is committed to using the Google Ads API responsibly and in full compliance with the **Google Ads API Terms of Service** and **API usage policies**.

Credential security	OAuth2 credentials are stored in a local .env file with restricted file-system permissions. The refresh token is never logged, transmitted, or shared. Client secrets are not embedded in source code.
No credential sharing	Each analyst uses their own OAuth credentials. API credentials are not distributed to end clients or third parties under any circumstance.
Minimal permissions	The OAuth scope is limited to https://www.googleapis.com/auth/adwords only. No additional Google account scopes are requested.
Controlled mutations	Write operations (enable/pause campaign, ad group, ad) are only performed when explicitly instructed by an authenticated internal analyst. There are no automated or scheduled write operations.
Rate limit compliance	The application is single-user and non-automated. Estimated daily API operations are well within Basic Access limits (< 500/day vs. 15,000 allowed). The application does not implement retry loops that could cause bursts.
No data resale	Google Ads data retrieved via the API is used solely for managing and reporting on our clients' own campaigns. Data is not sold, shared, or used for any purpose other than campaign management for the account owner.
Internal-only distribution	The application is not published, distributed, or offered as a service to external parties. It is a private internal tool for Mi Marketing Industrial staff.

7. Declaration & Contact

Mi Marketing Industrial confirms that the information provided in this document is accurate and complete. We agree to use the Google Ads API in compliance with the Google Ads API Terms of Service, the Google Ads API usage policies, and all applicable Google policies.

We understand that Basic Access is intended for development and testing purposes and that if our usage grows beyond the Basic Access limits, we will apply for Standard Access with the appropriate additional documentation.
